Ann Joseph

Game Developer

Computer Science student interested in game development and gameplay systems, comfortable with C++ and applying data structures and algorithms to solve problems. I enjoy working on game logic and writing clean, organized code, and I am currently looking for a Game Development internship to learn and grow as a programmer.

Skills

• Unity • Python • C++ • C# • OOP • Data Structures

• Algorithms

Certifications

Master 5G Mobile Network Technology with HCIA-5G
2026
NTI

Languages

Arabic
Native

English
Professional Proficiency

Projects

Hospital Priority Queue

Hospital Priority Queue is a hospital management project that organizes patients based on their emergency severity. I built an interactive web dashboard using HTML, CSS, and JavaScript, and also created a C++ console version using a priority queue. The system allows users to add patients, sort them by priority, manage doctors, and treat the most urgent patients first.

ECG Analysis

Browser-based ECG monitoring dashboard that visualizes live ECG waveforms, displays patient vitals, and supports importing patient data from JSON or CSV files for interactive review.

Freelancing Platform

Corevia is a full-stack freelancing and career platform built with Django REST Framework and React. It supports user authentication, freelancer/client profiles, service requests, proposals, jobs, internships, company profiles, notifications, and AI chat features.

SAT Solver

Built an interactive web-based SAT solver for a Discrete Mathematics project using HTML, CSS, and JavaScript. The app evaluates Boolean formulas, displays satisfiable/unsatisfiable results, and generates a full truth table showing TRUE/FALSE outcomes for all variable assignments.
